

Iran Nano 2009 Exhibit in Tehran , Product trial , Heritage listed structures

Short Project Description

Nanovations Iranian distribution partners took part at the Nano 2009 Exhibit in Tehran early November 2009. As one of the few companies at the exhibition, Nanovations Iran was able to show some real life products for surface treatments of concrete, stone, glass and metal.

The unique concept of the 3001 concrete and stone treatment for example, was so appealing to some of the visitors that trials have been organized to protect some of the oldest structures of human civilizations from the influence of weathering and pollution.

Application

3001 does not change the appearance of the material treated. Furthermore is the product a high concentrated solution. Only water is required as a solvent, which makes it an exceptionally environmentally friendly product.

Project Type

Product Presentation
Trial
Heritage listed

Notes

Due to the shipping in a concentrated form, only 20 liter of product is required to treat and protect up to 1000 square metre of concrete or stone. The savings in transport costs and the reduction in packaging material, waste and empty containers ending in landfills are remarkable.
